

### Task 3 – Interview questions

#### 1. Tell me about yourself.

We are a team of IT Support professionals who recently completed the Google IT Support Professional Certificate through the Capaciti Tech Career Accelerator. We have experience in Windows and Linux administration, networking, hardware troubleshooting, and security. We also have backgrounds in software development, data analysis, and systems support. We are looking for IT Support roles where we can apply our technical skills to help users and maintain business systems.

#### 2. Why do you want to work in IT Support?

We enjoy solving problems and helping people. IT Support allows us to use our technical knowledge while working directly with end-users. It also gives us a strong foundation in how systems work — which is valuable for any career in technology. We want to build our careers in IT and eventually move into areas like system administration, security, or cloud infrastructure.

#### 3. A user says their computer won't turn on. What do you do?

First, we check the simple things. Is the power cable plugged in securely at both ends? Is the power strip switched on? We test the wall outlet with another device. If the computer still won't turn on, we try a different power cable. If that fails, the power supply unit may need replacement.

#### 4. How do you troubleshoot a network connectivity issue?

We start by checking if other devices on the same network have internet. If yes, the issue is isolated to one device. We check the device's Wi-Fi or Ethernet connection. Then we run `ipconfig` on Windows or `ifconfig` on Linux to check for a valid IP address. We ping the gateway, then ping 8.8.8.8, then ping a website. This isolates the failure point — whether it is DNS, routing, or physical connection.

#### 5. A user accidentally deleted an important file. What do you do?

First, we check the Recycle Bin. If the file is not there, we restore it from the most recent backup. We have daily backups on the NAS. We locate the file in the backup interface and restore it to its original location. Then we confirm with the user that the file is recovered.

#### 6. How do you handle an angry or frustrated user?

We stay calm and listen first. We let the user explain the problem without interrupting. We acknowledge their frustration by saying something like "I understand this is disrupting your work." Then we focus on solving the problem as quickly as possible. Once resolved, we follow up to make sure everything is working.

7. What is the difference between TCP and UDP?

TCP is connection-oriented and reliable. It checks that data arrives correctly and in order. It is slower but more accurate. UDP is connectionless and faster but does not guarantee delivery or order. TCP is used for web browsing and email. UDP is used for live streaming, video calls, and gaming.

8. What is DHCP and what does it do?

DHCP stands for Dynamic Host Configuration Protocol. It automatically assigns IP addresses to devices on a network so you do not have to configure each one manually. When a device connects, DHCP gives it an available IP address, subnet mask, gateway, and DNS servers.

9. Tell me about a time you solved a technical problem.

During our capstone project, we documented a case where a user's desktop would not power on. We checked the power cable and found it was loose at the back of the computer. We reseated it firmly, and the computer powered on normally. The user was back to work within 10 minutes. We secured the cable with a cable tie to prevent it happening again. This taught us the importance of checking physical connections first.

10. Where do you see yourself in two years?

In two years, we see ourselves working in IT Support roles, handling more complex issues and possibly specializing in areas like system administration, networking, or security. We also want to continue learning — pursuing certifications like CompTIA Network+ or Security+ to grow our careers.
